

CDR announce online Streetlight Fault Reporting facility

Responding to customer demand, CDR have added a Streetlight reporting facility to their Browse-A-Map product. Users are able to interface GIS datasets through a simple web browser interface...

A general location can be found easily using a post code or street name search.

Any individual streetlight can then be identified and selected.

A form then prompts users to report any problems or faults back to the data custodian immediately.

"The idea is to allow Local Authorities to fulfil the G5 and G14 [GIS] requirements of the Priority Outcomes document [published by the ODPM in April 2004] quickly, with minimum fuss and expense." - Ben Farrow - CDR Software Development Team.
