Introducing MapInfo Professional® v11

We are delighted to announce the launch of MapInfo Professional 11. The official launch of MapInfo Professional in the UK took place at the MapInfo User Group Summer Conference in Bristol on 21st June 2011. For clients on the Annual Maintenance Program, you will receive your notifications by email shortly after this date.

MapInfo Professional v11.0 addresses key usability and business problems related to spatial data creation, analysis, access and spatial data management. The new browser window offers advanced data entry options and follows the latest industry practices that result in a simple yet effective alphanumeric data entry experience. MapInfo Professional's direct integration with MapInfo Manager promotes effective use of an organisation's spatial data. The all new Premium Services option makes road level contextual data or navigating a map as easy as clicking a button or typing an address.

Benefits of MapInfo Professional v11 include:

Faster tabular data creation and analysis via the all new Browser Window. There is improved ease of use and productivity when working with tabular data based on using Microsoft grid controls to provide better navigation.

There is enhanced support of 64-bit operating systems. Users can address up to 4 GB RAM instead of 2 GB. Memory hungry operations benefit from this improvement such as:
large geographic data processing tasks such as combining several of regions together opening or exporting large image files creating geo-registered PDF files with attributes.

Bing Maps premium services are now an add-on option to MapInfo Professional. There is access to hybrid and aerial imagery as before, along with the ability to search on a location and move the map to that location.

Direct integration with MapInfo Manager, enabling efficient searching, accessing and management of spatial data throughout an organisation.

And more...
